

Spider-Society Savior - Setup Guide

Here's a quick guide to getting your project up and running in Visual Studio Code (VS Code).

Your Mission

Doc Ock has hacked the network. Your job is to:

1. **Clean up the Landing Page (`index.html`):** Fix the broken HTML, remove the neon green background, and hide the Doc Ock image using CSS.
2. **Add the Memo:** Insert the official Spider-Society welcome text onto the restored page.
3. **Build the Gadget Lab (`gadget-lab.html` & `script.js`):** Finish the second page by programming a button to randomly generate web-shooter upgrades from a JavaScript array.
4. **Be Creative!** Have some fun with this project and go beyond the features asked of...the more the merrier!!

VS Code Setup

1. Download and install [VS Code](#) if you haven't already.
2. Open VS Code, go to **File > Open Folder**, and select your project folder.
3. Open the Extensions view by clicking the blocks icon on the left sidebar (or press `Ctrl+Shift+X` / `Cmd+Shift+X`).
4. Search for **Live Server** (by Ritwick Dey) and click **Install**.

Running the Project

1. Open the `index.html` file in VS Code.
2. Right-click anywhere inside the code and select **Open with Live Server** (or click the "Go Live" button at the bottom right of your screen).
3. Your default web browser will automatically open the site.
4. Every time you save your HTML, CSS, or JS files, the browser will automatically refresh to show your changes!

Let's Geaux have some Fun!!
